TEST YOUR KNOWLEDGE
BACK TO NATURE

      by Lauren Barczak

LAUREN BARCZAK
UD Wildlife Ecology Major

To reduce stress and strengthen our immune systems, experts often point us to the outdoors. So let's get moving! There's lots to see and hear, absorb and appreciate in nature.

Explore the scene below at Delaware's Brandywine Springs along Red Clay Creek, which was a Revolutionary War encampment of General George Washington's Army. By scrolling left, right, top and bottom, see if you can find the five clues that will help you answer the six questions.

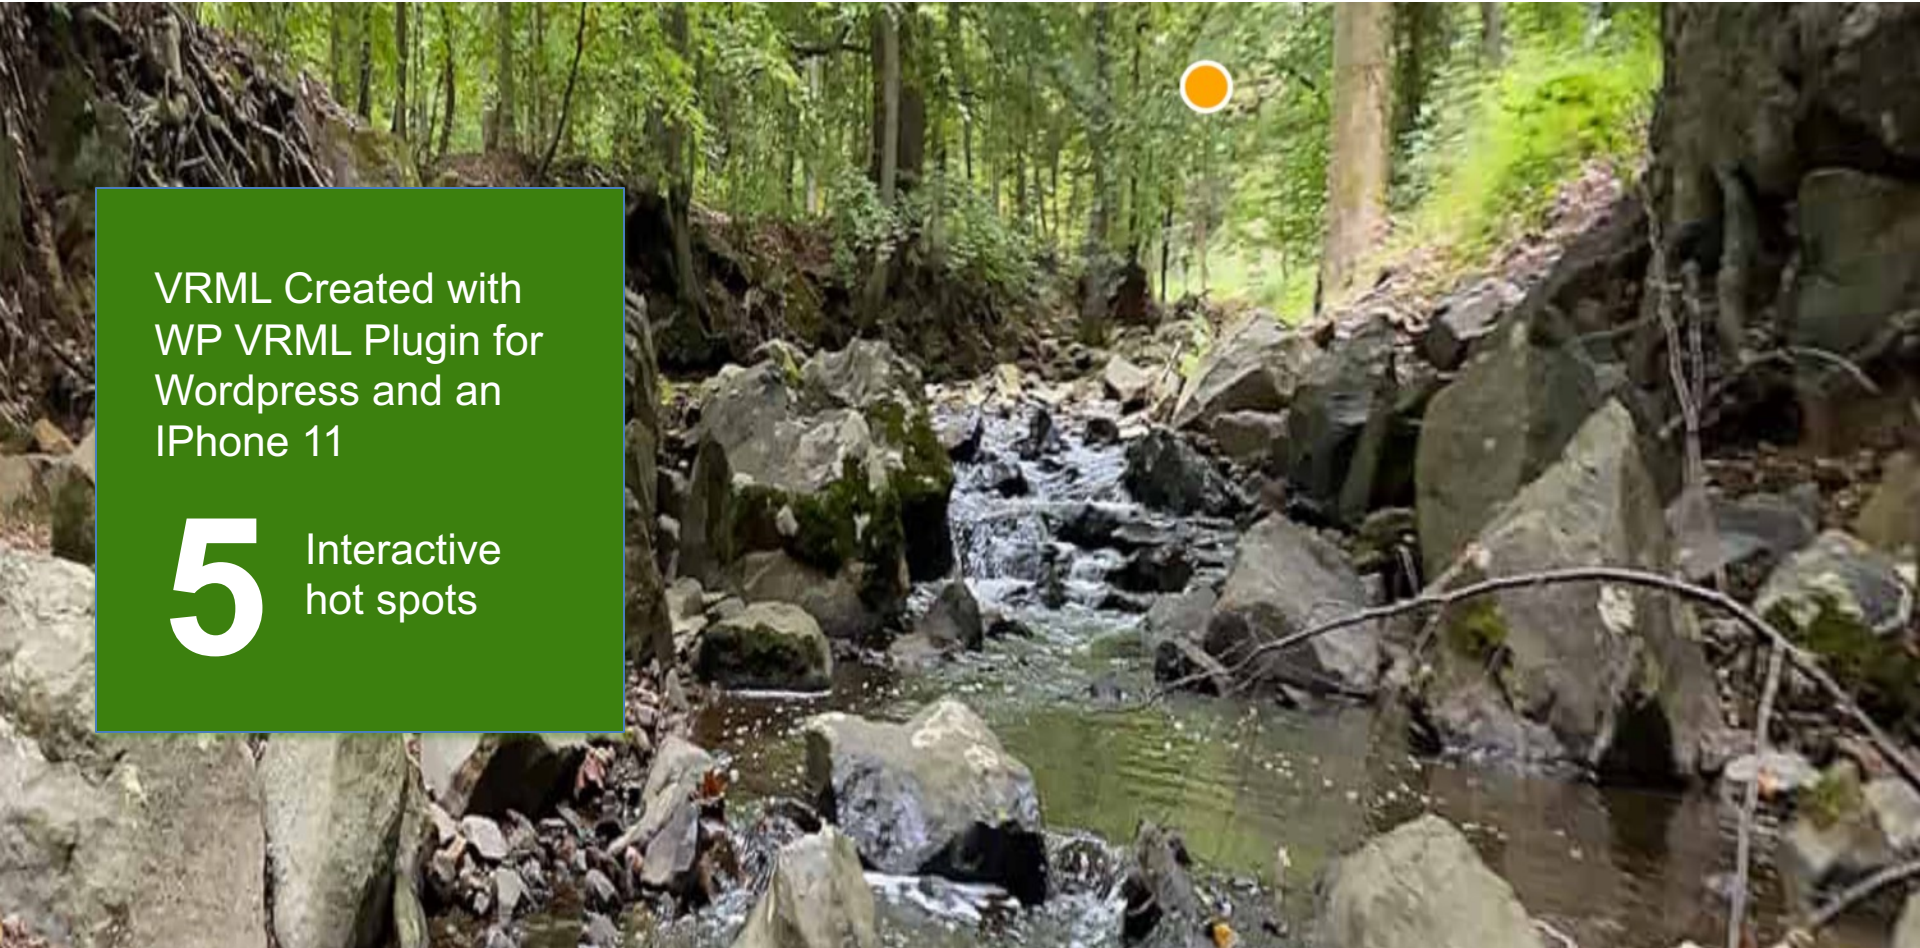

Migratory bird populations such as thrushes, warblers, orioles and more face rapid declines due to what factors?

- Light Pollution
- Climate Change
- Habitat Loss
- All of these

Pictured here: Tennessee Warbler.

JOURNEY SOUTH

Each fall, billions of birds migrate south for the winter. Around 200 species of birds are considered neotropical migrants, breeding in Canada and the United States during our summer months and spending the winter in Mexico, Central America, South America or the Caribbean Islands. Thrushes, warblers, tanagers and more migrate through the night on their journey south and rest during the day when possible. These two phases of migration (passage and stopover) and where and when they occur are important to bird conservation and behavior.

Migratory bird populations face rapid declines due to many interacting factors including light pollution, climate change, and habitat loss and degradation. Researchers hope that the stopover-to-passage ratio can offer additional insight and renewed interest in understanding stopover sites.
